Sensitivity analysis

Sensitivity analysis (SA)

$$(U_1, \dots, U_d) \xrightarrow{f} Y = f(U_1, \dots, U_d)$$

How can the uncertainty of Y be divided and allocated to the uncertainty of the inputs U_i ?

- Sobol indices : $S_i = \frac{\text{Var } \mathbb{E}(Y|U_i)}{\text{Var } Y}$
- Dependence measures : $S_i = ||\mathbb{P}_{(U_i, Y)} - \mathbb{P}_{U_i} \otimes \mathbb{P}_Y||$
 - Density-based indices (Borgonovo 2007)
 - Cramer von mises indices (Gamboa, Klein et Lagnoux 2018)
 - Hilbert Schmidt Independence Criterion : [HSIC](#) (Gretton, Bousquet et al. 2005)

Screening : U_1, \dots, U_k are influential and U_{k+1}, \dots, U_d are not influential

Ranking : $U_1 \prec \dots \prec U_d$

Sensitivity analysis

Sensitivity analysis (SA)

$$(U_1, \dots, U_d) \xrightarrow{f} Y = f(U_1, \dots, U_d)$$

How can the uncertainty of Y be divided and allocated to the uncertainty of the inputs U_i ?

Ranking : $U_1 \prec \dots \prec U_d$

What if the output Y is set-valued ?

A toy excursion set

Excursion sets

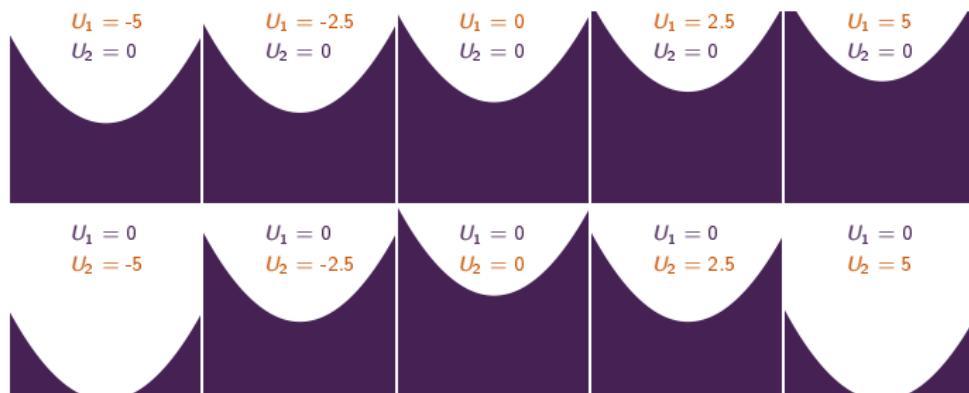

New output :

$$\Gamma_U = \{x \in \mathcal{X}, g(x, U) \leq 0\}, \quad (1)$$

which is called a random excursion set.

Toy function from [El-Amri et al. 2021]

$$\forall (x, u) \in [-5, 5]^4 \quad g(x, u) = -x_1^2 + 5x_2 - u_1 + u_2^2 - 1$$

How can we do sensitivity analysis on (excursion) sets?

Distribution embedding into a RKHS

Dependence measures : $S_i = \|\mathbb{P}_{(U_i, Y)} - \mathbb{P}_{U_i} \otimes \mathbb{P}_Y\|$

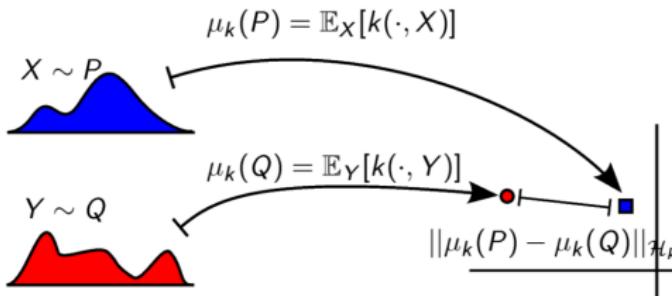

Figure – Kernel mean embedding

with k a (positive definite) kernel $k : (x, x') \in \mathcal{X}^2 \mapsto k(x, x') \in \mathbb{R}$.

Hilbert Schmidt Independence Criterion (HSIC), Gretton, Borgwardt et al. 2006

With a kernel $K = k_{\mathcal{Y}_i} \otimes k_{\mathcal{Y}}$, the HSIC is given by :

$$\text{HSIC}_K(U_i, Y) = \|\mu_K(U_i, Y) - \mu_{k_{\mathcal{U}_i}}(U_i) \otimes \mu_{k_{\mathcal{Y}}}(Y)\|_{\mathcal{H}_K}^2$$

When K is characteristic (injectivity of the mean embedding),

$$\text{HSIC}_K(U_i, Y) = 0 \text{ iif } U_i \perp Y \rightarrow \text{screening}.$$

HSIC-based indices

- When K is characteristic (injectivity of the mean embedding),

$$\text{HSIC}_K(U_i, Y) = 0 \text{ iif } U_i \perp Y \rightarrow \text{screening}.$$

- Easy to estimate (sum of three U-statistics)

$$\begin{aligned}\text{HSIC}_K(U_i, Y) &= \mathbb{E}[k_{\mathcal{U}_i}(U_i, U'_i)k_Y(Y, Y')] \\ &\quad + \mathbb{E}[k_{\mathcal{U}_i}(U_i, U'_i)]\mathbb{E}[k_Y(Y, Y')] \\ &\quad - 2\mathbb{E}[\mathbb{E}[k_{\mathcal{U}_i}(U_i, U'_i)|U_i]\mathbb{E}[k_Y(Y, Y')|Y]].\end{aligned}$$

- ANOVA-like decomposition (daVeiga 2021) if the inputs are independent and the input kernels are ANOVA :

$$\text{HSIC}(\mathbf{U}, Y) = \sum_{A \subseteq \{1, \dots, d\}} \sum_{B \subseteq A} (-1)^{|A|-|B|} \text{HSIC}(\mathbf{U}_B, Y)$$

$$\left. \begin{aligned} S_i^{\text{HSIC}} &:= \frac{\text{HSIC}(U_i, Y)}{\text{HSIC}(\mathbf{U}, Y)} \\ S_{T_i}^{\text{HSIC}} &:= 1 - \frac{\text{HSIC}(\mathbf{U}_{-i}, Y)}{\text{HSIC}(\mathbf{U}, Y)} \end{aligned} \right\} \rightarrow \text{ranking}$$

- Only require (characteristic) kernels on the inputs and on the output (whatever the type of inputs/outputs you have)

SA on sets : a kernel between sets

With $A\Delta B = A \cup B - B \cap A$ and λ the Lebesgue measure, we define a kernel on the Lebesgue σ -algebra $\mathcal{B}(\mathcal{X})$ by :

$$\forall \Gamma_1, \Gamma_2 \in \mathcal{B}(\mathcal{X}), k_{set}(\Gamma_1, \Gamma_2) = \exp\left(-\frac{\lambda(\Gamma_1 \Delta \Gamma_2)}{2\sigma^2}\right).$$

Proposition (A kernel between sets)

k_{set} is a kernel [Balança et Herbin 2012] and is characteristic.

For a given random excursion set $\Gamma_U = \{x \in \mathcal{X}, g(x, U) \leq 0\}$, we can define HSIC-based indices on sets :

$$S_i^{H_{set}} := \frac{\text{HSIC}_{k_{set}}(U_i, \Gamma_U)}{\text{HSIC}_{k_{set}}(U, \Gamma_U)},$$

which quantifies how much U_i impacts the excursion set Γ .

k_{set} is characteristic, sketch of proof

- $\mathcal{B}(\mathcal{X}) \rightarrow \mathcal{B} = \mathcal{B}(\mathcal{X}) / \sim_\delta$ where δ is the volume of the symmetric difference and \sim_δ the equivalent relation $A \sim_\delta B$ iff $\delta(A, B) = 0$ i.e. A and B are equal except on a λ -negligible set.
- We show that (\mathcal{B}, δ) is a Polish space (separable completely metrizable topological space). (\mathcal{B}, δ) is a metric space so we just need separability and completeness. Separability holds as "it's a subspace of $L_2(\mathcal{X})$ " and we show that it's closed.
- We use a Proposition from Ziegel, Ginsbourger et Dümbgen 2022,

Proposition (Ziegel, Ginsbourger et Dümbgen 2022)

Let \mathcal{B} be a Polish space, H a separable Hilbert space, T a measurable and injective mapping from \mathcal{B} to H , and $\varphi \in \Phi_\infty^+$. Then, the kernel k on \mathcal{B} defined by

$$k(\gamma, \gamma') := \varphi \left(\|T(\gamma) - T(\gamma')\|_H^2 \right), \quad \gamma, \gamma' \in \mathcal{B}$$

is integrally strictly positive definite with respect to $\mathcal{M}(\mathcal{B})$ (which implies that it is characteristic).

with $H = L_2(\mathcal{X})$, $\varphi = \exp(-\frac{\cdot}{2\sigma^2})$ and T defined by $T(\gamma) := x \mapsto \mathbb{1}_\gamma(x)$ for any $\gamma \in \mathcal{B}$ so that $\|T(\gamma) - T(\gamma')\|_H^2 = \lambda(\gamma \Delta \gamma')$.

- Pollutant concentration maps

Toy function 1

From El-Amri et al. 2021,

$$\forall x, u \in [-5, 5]^2 \times [-5, 5]^3 \quad g(x_1, x_2, u_1, u_2, u_3) = -x_1^2 + 5x_2 - u_1 + u_2^2 - 1$$

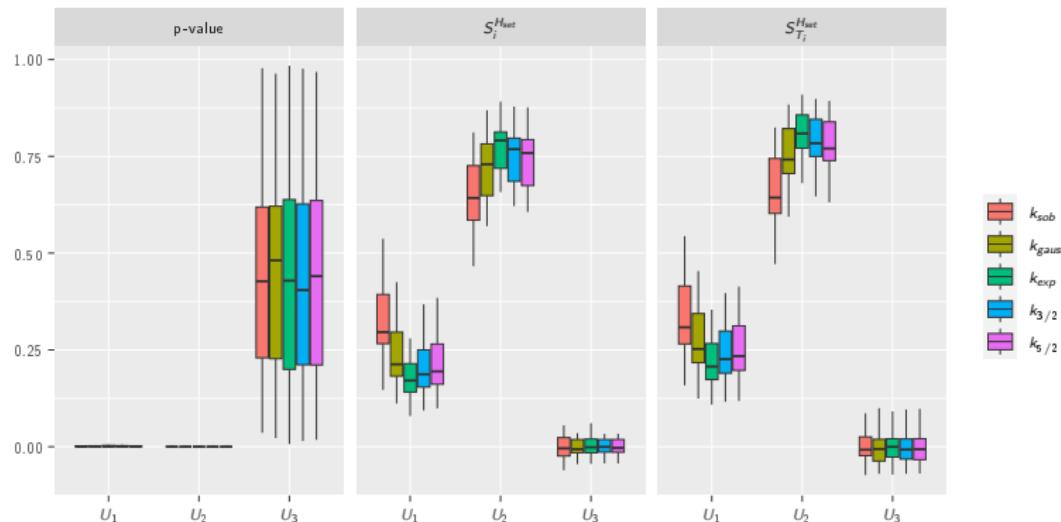

Figure – Estimation of the p-values, $\hat{S}_i^{H_{set}}$ and $\hat{S}_{T_i}^{H_{set}}$ for the excursion set defined by the constraint $g \leq 0$ computed for 5 input kernels with $n = 100$, $m = 100$ and repeated 20 times

Pollutant concentration maps : Maps of Sobol indices

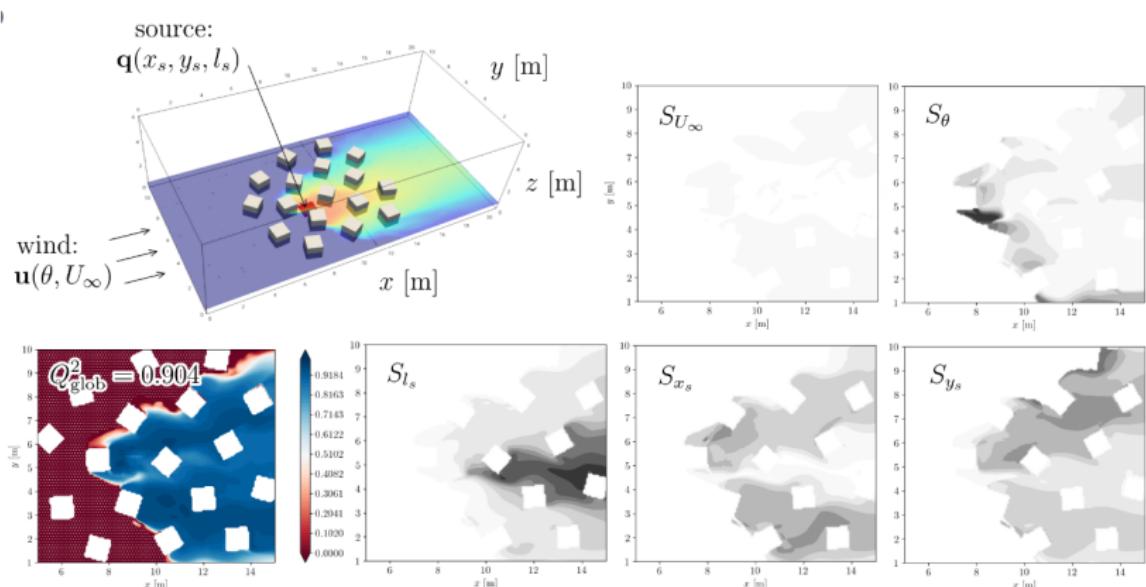

Figure – Maps of the sobol indices of pollutant dispersion (Mathis Pasquier)

Interpretation :

$$S_{l_s} \gg S_{x_s} \approx S_{y_s} \approx S_\theta \gg S_{U_\infty}$$

Kernel-based SA on pollutant concentration maps

Sobol map interpretation : $S_{I_s} \gg S_{x_s} \approx S_{y_s} \approx S_\theta \gg S_{U_\infty}$.

$\forall (x, y) \in [5, 15] \times [1, 10]$, $g(x, y, U)$ is the pollutant concentration at the point (x, y) for a given uncertain parameter U . What is the set-valued output ?

- Test 1 : $\Gamma_U = \{(x, y) \in [5, 15] \times [1, 10], g(x, y, U) \geq C_{seuil}\}$. C_{seuil} to choose (toxicity threshold).

	θ	U_∞	x_s	y_s	I_s
P-value	$6.6 \cdot 10^{-4}$	0.11	0	0	0
$S_i^{H_{set}}$	0.069	0.016	0.25	0.15	0.48

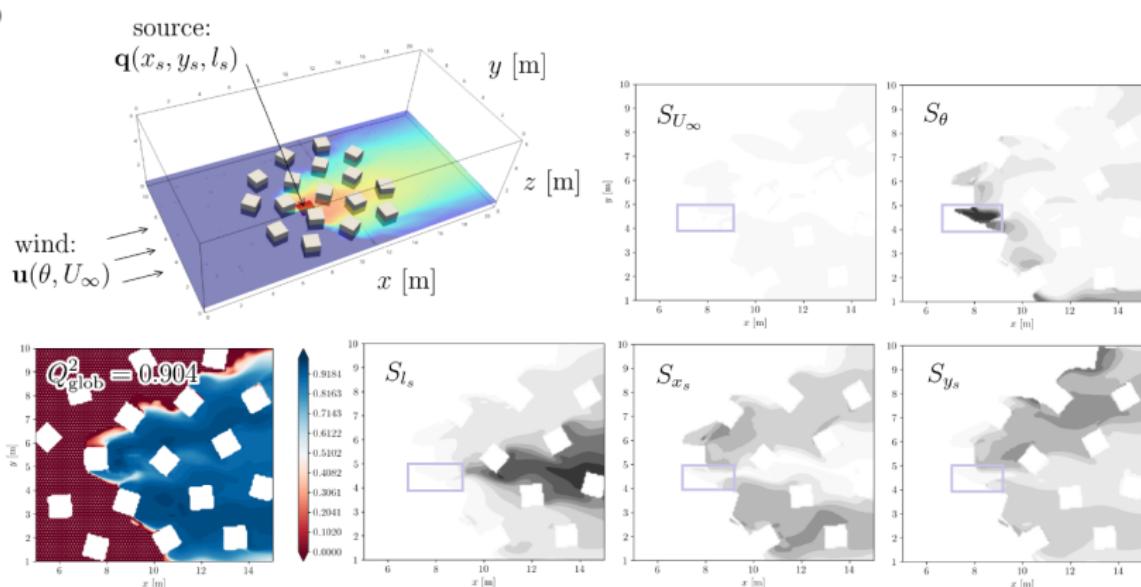

- Test 2 : $\Gamma_U = \{(x, y, z) \in [5, 15] \times [1, 10] \times [C_{min}, C_{max}], z \leq g(x, y, U)\}$

	θ	U_∞	x_s	y_s	I_s
P-value	$6.6 \cdot 10^{-3}$	0.77	0.026	0.010	0
$S_i^{H_{set}}$	0.11	0.0081	0.20	0.17	0.50

In both cases we obtain :

$$S_{I_s} > S_{x_s} > S_{y_s} > S_\theta > S_{U_\infty}$$

Kernel-based SA on pollutant concentration maps : subspace

$$\Gamma_U = \{(x, y, C) \in [7, 9] \times [4, 5] \times [C_{\min}, C_{\max}], C \leq g(x, y, U)\}$$

- $\widehat{k_{set}}(\Gamma^{(i)}, \Gamma^{(j)}) = \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X^{(k)})\right)$
- $\widehat{\widehat{H}_{set}}(U_I, \Gamma) = \frac{2}{n(n-1)} \sum_{i < j}^n \left(k_I(U_I^{(i)}, U_I^{(j)}) - 1 \right) \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X^{(k)})\right)$

HSIC-ANOVA on sets, estimation

- $H_{set}(U_I, \Gamma) := HSIC_{k_I, k_{set}}(U_I, \Gamma) = \mathbb{E}[(k_I(U_I, U_I') - 1)k_{set}(\Gamma, \Gamma')]$
- $\widehat{H}_{set}(U_I, \Gamma) = \frac{2}{n(n-1)} \sum_{i < j}^n \left(k_I(U_I^{(i)}, U_I^{(j)}) - 1 \right) k_{set}(\Gamma^{(i)}, \Gamma^{(j)})$
- $\widehat{k_{set}}(\Gamma^{(i)}, \Gamma^{(j)}) = \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X_{i,j}^{(k)})\right) \rightarrow n(n-1)m \text{ tests of } X \in \Gamma$
- $\widehat{k_{set}}(\Gamma^{(i)}, \Gamma^{(j)}) = \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X^{(k)})\right)$
- $\widehat{\widehat{H}}_{set}(U_I, \Gamma) = \frac{2}{n(n-1)} \sum_{i < j}^n \left(k_I(U_I^{(i)}, U_I^{(j)}) - 1 \right) \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X^{(k)})\right)$

Proposition

The quadratic risk of the nested estimator $\widehat{\widehat{H}}_{set}$ verifies :

$$\mathbb{E} \left(\widehat{\widehat{H}}_{set}(U_I, \Gamma) - H_{set}(U_I, \Gamma) \right)^2 \leq 2 \left(\frac{2\sigma_1^2}{n(n-1)} + \frac{4(n-2)\sigma_2^2}{n(n-1)} + \frac{L^2\sigma_3^2}{m} \right).$$

HSIC-ANOVA on sets, estimation

- $H_{set}(U_I, \Gamma) := HSIC_{k_I, k_{set}}(U_I, \Gamma) = \mathbb{E}[(k_I(U_I, U_I') - 1)k_{set}(\Gamma, \Gamma')]$
- $\widehat{H}_{set}(U_I, \Gamma) = \frac{2}{n(n-1)} \sum_{i < j}^n \left(k_I(U_I^{(i)}, U_I^{(j)}) - 1 \right) k_{set}(\Gamma^{(i)}, \Gamma^{(j)})$
- $\widehat{k_{set}}(\Gamma^{(i)}, \Gamma^{(j)}) = \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X_{i,j}^{(k)})\right) \rightarrow n(n-1)m \text{ tests of } X \in \Gamma$
- $\widehat{k_{set}}(\Gamma^{(i)}, \Gamma^{(j)}) = \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X^{(k)})\right)$
- $\widehat{\widehat{H}}_{set}(U_I, \Gamma) = \frac{2}{n(n-1)} \sum_{i < j}^n \left(k_I(U_I^{(i)}, U_I^{(j)}) - 1 \right) \exp\left(-\frac{\lambda(\mathcal{X})}{2\sigma^2} \frac{1}{m} \sum_{k=1}^m \mathbb{1}_{\Gamma^{(i)} \Delta \Gamma^{(j)}}(X^{(k)})\right)$

Proposition

The quadratic risk of the nested estimator $\widehat{\widehat{H}}_{set}$ verifies :

$$\mathbb{E} \left(\widehat{\widehat{H}}_{set}(U_I, \Gamma) - H_{set}(U_I, \Gamma) \right)^2 \leq 2 \left(\frac{2\sigma_1^2}{n(n-1)} + \frac{4(n-2)\sigma_2^2}{n(n-1)} + \frac{L^2\sigma_3^2}{m} \right).$$

We can now compute $S_i^{\widehat{H}_{set}}$ or $S_{T_i}^{\widehat{H}_{set}}$ to perform SA on set-valued outputs.
